

Dear future ally-

There are several concerns about different energy related issues and one I am worried about is windmills. They have killed several birds and bats in the night and in the day which I find is an issue. There are many advantages with wind power such as: it creates jobs, it is a clean source of energy, better than power plants that pollute the air, and there are many more. There are also a few disadvantages of wind power such as: it can impact local wildlife, like killing birds and bats, it has also increased in cost to keep building them, and some places may not be windy enough. I would also like to ask you (my future self) if any of these issues have had a turn, maybe the cost went down or less birds have been killed, but how much is better with wind power?

Another question is have more been built and have more made a change to the environment? That's all I have to ask. I think that things have to be changed with wind power.
