## Solar is the best

Solar is a type of energy that uses panels that are put on the roof and collects the sun energy. The panels are made out of silicon, the material comes from sand but could be mined out. The panels collect sun by having photovoltaic cells that turn sunlight into electricity. Solar uses renewable energy. Renewable energy is good because it does not hurt the earth, nature, and habitats. This is important because if we hurt the environment, there will be no nature and we could be harmed since without trees we can't get enough oxygen. It will keep going and does not have a short supply. The supply is limitless since the sun is always there so you will not run out of electricity. It is not like coal where you need to mine and hurt the environment; it is only using panels and the sun. Also, it is pollution-free.

Solar does not hurt animals, habitats, and nature. This is important because if we hurt the habitats, animals will start to die and we will have no animals left for eating meat or any other food. If nature is harmed, we will have no paper from trees and also wood. There will be no fresh vegetables and fruits if this gets worse. Wind hurts birds and nests, which is lowering the bird population, but solar does not harm.

Solar lowers your carbon footprint. This is good and important since if you have a high electricity bill, this will lower it and save your money. Also, it will not be as expensive to buy and has a 22500 cost amount, but it is good quality and will not go to waste.

They are wrong because solar has so many good things and not as much disadvantages and it is not like wind that will hurt nature with floods or animals with its system it does not impact the environment like coli does by mining solar does not hurt animals or their habitats like wind does.
