

Dear future selves,

We really hope you are doing your part in energy use. We use a lot of energy right now, especially right now and the last year, everyone at home because of the pandemic. I really hope we got the pandemic under control because everyone's families at home people have lights on, more dishes need washed. Is there a more energy efficient way to wash dishes? Are things better or are things worse? Is there new ways to prevent pollution? More cars like Tesla? What is going on with climate change? Is the amount of ice going downhill still? Are we doing more to stop it? Right now masks are a big problem, littering and animals choking! Where is Greta Thunberg? Greenhouse gas emissions are a HUGE problem right now from human activities, like burning fossil fuels. Like factories are working even more because people can't go into stores. With a lot of people doing online school there is a lot more power being used and wifi. 63% of our electricity comes from burning fossil fuels. There has been a lot of changes to try and help "save our world" but there is a lot that needs to still change. Many people don't believe in climate change.

I hope we are doing better,

Ava and Ali!
