

Dear future and future me,

These current as well as present energy issues happening in my time right now all revolve around how most people of my time aren't being rather energy conservative. At times where we can go towards saving energy and being fuel efficient we throw all opportunities most of the time. Currently what's happening speaking of around the time period that I am writing this letter manufacturers and various industries are legitimately struggling to find fresh forms of energy to use. Although energy is a source that is rather crucial within our lives people are using it in an unethical manner as if we have loads of the energy kind. Yet when in reality our energy source and amount of non-renewable fossil fuels are becoming fairly scarce. However these energy issues and scarcities are only coming about due to our inability to conserve our essential energy resources smartly. People have a tendency to leave lights on even when they're not using them, let tap water run where they forget to turn it off when not in proper usage, drive cars to places as well as locations alike even if they are rather close to them, and just many irresponsible actions alongside behaviour that deeply affects how we conserving manner utilize our energy at its fullest potential. Correspondingly, all these little energy misuses done at least once in a while by practically every household adds up to a mind blowing amount of diminished energy that could have been used for essential purposes. Furthermore, this is my message to you future as well as my future self that if we don't start acting now sooner or later all our energy resources will have been completely depleted in which some would have been used for careless reasons where you could have just simply did an energy sort of conservation action that would have helped the planet a ton. You could turn off your lights whenever they are not in use, shut off a running water tap faucet when not really in need of it whether you are shaving, brushing your teeth or any other such activity that uses your tap, ride your bike instead of transportation that emits constant pollution on a basis where at the same time you are getting physical activity done through the process, and a whole bunch of other methods as well as ways of saving energy through tasks that bring great benefit when it comes to properly utilizing your energy sources in a conservative overall manner. These are all examples of methods and solutions that can help us as well as people alike to rejuvenate our energy storages of the such source for many future generations to come. People want energy to last long enough and be on-going so that running establishments can be around for humanity in the many ever-lasting coming years. However in order for this substantial goal to be there and be more so achieved we must first take the step of taking conserving energy into consideration so the rate at which energy depletes at goes down, and can then therefore replenish with these simple certain ways into properly saving our energy. So it is my message from me to you, future self as well as the future people itself. What will you do to smartly utilize your energy resources so that your amount of energy is plentiful for all? Make sure that you only use your energy sources necessarily so that you don't end up having the same energy issue crisis we are somewhat having in this current present time that in which I am writing this specific letter. Energy is important to power up our daily lives, and so these are current day energy issues that I have overall discussed in this letter. Therefore it is now up to you future me and future people reading this letter to make it your distinct assigned mission to prevail towards smartly saving your energy. Good luck and I hope you succeed in not making the same careless misusages of energy as we are doing now today in this current status day! I wish you all the best in using your energy sources wisely and overall conversing manner so that many generations can have the same privileges in having loads of energy to last them a good lifetime to carry them on through their days! Today people are working towards having enough energy for you future me and future people, so why not do the same for the next even further future people!

Sincerely,  
Gitan Mathiroban
