

**Raw materials**

When designing products and goods we need to package them in an environmentally friendly method. Such as recycled and renewable materials

**production and packaging**

**recycle**

# CIRCULAR ECONOMY

When a product is broken and unable to be fixed, we can use these products to create new products and we can re-use and recycle.

**re-use**

**utilization**

The main goal is to keep products and materials circulating for a long period of time. If something is unused or unnecessary, or broken it can be fixed or given another purpose or make new products

For many years humans have had a repetitive pattern of wastage. Thus, causing toxic waste. But need to stop this pattern and use products and materials for much longer. We can also use the materials inside the product to designing another product.
